Knowing user expectations

It is by understanding user expectations that you can identify their needs.

Designing a solution is only justified if it meets an essential need, that is, if it addresses a critical issue for users.

Taking the time to talk with them, using a mockup, helps bring out what lies at the heart of their concerns. To facilitate these discussions, you can rely on an interview guide.

Interview guide of Shipmark Project

Interview guide - Projet Shipmark

First Name: ...

Name: ...

Age: ...

Education: ...

Occupation: ...

Place of residence: ...

Personality traits: ...

1. Get to know your interviewee

Can you tell me about your current role within your organization?

...

What has been your career path leading to this position?

...

What are your main daily responsibilities?

Erik EMOTTE lundi

The interview guide is the tool that allows you to clearly understand what users expect and what their needs are.

For the Shipmark project, the interview guide should enable the team to:

- Get to know their interviewees (their exact role, profile, and daily tasks)
- Understand their context (the stakeholders they work with, the critical situations that require quick decisions)
- Discuss their expectations (the difficulties they face, their interest in the proposed solution, their perception of its relevance)

Structured around open but targeted questions, the interview guide makes it possible to obtain precise and comparable answers from one interviewee to another, while keeping the conversation within a limited time.

Shipmark Project mockup

Shipmark Project mockup

Early adopter

Mockup of the Proposed Detection Technology

Questions asked to early adopters :

- Does a similar detection technology for ships seem relevant to you ?
- Based on the mockup above, do you think the detection is accurate enough ?

© COmind

Erik EMOTTE

EE The mockup allows users to concretely visualize the proposed solution and project themselves into its use.

In the case of Shipmark, it illustrates the principle of how the AI works and helps verify that it properly addresses the issue of ship detection.

Preparing precise questions related to the mockup is essential to gather useful feedback on the proposed solution before actually designing it.

First objective to reach

Do you know what users expect ?

1.
User expectations identified

2.
Needs understood

3.
Critical issue addressed

© COmind

Understand users' needs

Needs are linked to expectations where the user feels blocked.

Before proposing a solution, it is essential to understand users' needs in order to know what should be addressed.

Personas help make these needs explicit and more concrete. They can be built from the different interviews conducted.

Shipmark Project interview

Shipmark Project interview

First Name : Matthieu Name : Gélébart
Education : Vocational Diploma (BEP) in Fishing Vessel Operations
Current position : Maritime Area Controller
Organization : La Marine Nationale (The French Navy)

1. Getting to know the contact

Matthieu Gélébart, as **a maritime area controller**, is **responsible for monitoring**, **coordinating**, and **securing maritime traffic**, particularly **along the French coastline**. After completing **a vocational diploma in fishing vessel operations**, he **joined the French Navy**, where he received **specialized training** in **navigation**, **maritime regulations**, and **control tools**. He has been working **as a maritime controller for over 20 years**.

2. Understanding his context

He works **at the Naval Operations Center in Brest**, in coordination **with the Semaphores**, **the CROSS** (Regional Operational Surveillance and Rescue Centers), **the maritime prefectures**, and **the merchant navy**. He must **make very quick decisions**, especially **in cases of danger** or **rescue at sea**.

3. Discussing his expectations

He is **eager for new technologies**. He finds **our project very interesting** for detecting vessels that are not publicly visible. He is looking **to gain efficiency**, **especially in emergencies**. Sometimes every second counts, and anticipation is crucial in his work. **Ghost ships** are becoming **an increasing problem and a real danger** — **our project could help address this issue**, especially if we can **determine their direction**.

© COmind

EE The interview is a key element to precisely understand users' expectations.

The interview with Matthieu Gélébart allowed the Shipmark team to gain a better understanding of the role of Maritime Space Controller, his work environment, and the challenges he faces.

Thanks to this exchange, the team was able to clearly identify what he needs to perform his job effectively and pinpoint the main problems to address as a priority — notably the need to know the directions taken by detected ships, a crucial element for maritime surveillance.

Persona of Shipmark Project

Persona of the Shipmark Project

Mike – Maritime Controller
Marine Française (French Navy)

Age : 32 years

Education : Naval School of Matelots (Querqueville)

Occupation : Maritime Controller – French Navy

Place of residence : Brest

Personality traits : Meticulous, dedicated

The needs

- Improve maritime surveillance and safety.
- Receive training to stay at the cutting edge of technology and best practices in maritime security.
- Quickly share crucial information with other agencies and organizations.

"In charge of monitoring and controlling maritime traffic off the French coast, my mission is to anticipate dangerous behaviors."

"I must ensure compliance with maritime law and coordinate sea rescue operations within very short timeframes."

"We are constantly looking for new technologies that allow us to better identify suspicious ships and their direction, saving us time."

© COmind

Erik EMOTTE

EE Mike, the persona of the Shipmark project, perfectly illustrates a potential user of the proposed solution.

His profile helps us understand who he is, and the verbatims collected during the interviews provide insight into his missions, his context, and what he is looking for.

His needs are clearly stated, which makes it possible to precisely identify the solution to be proposed to him.

This type of persona is a valuable tool for putting oneself in the user's shoes and defining the features of the solution to be developed.

Second objective to reach

Do you understand the users' needs ?

1.
User expectations identified

2.
Needs understood

3.
Critical issue addressed

© COmind

Address a critical issue

Once users' needs are understood, the task is to identify a recurring and essential need, whose resolution can change their lives.

The objective is to solve a critical issue in their eyes, in order to justify developing a solution.

The more critical the issue is, the more likely users will be to quickly adopt a new solution, even if it has not yet been proven.

© COmind

Shipmark user problem

Shipmark user problem

What ? : Quickly locate a vessel when its signal is lost, using its heading and size.

Who ? : Maritime services, especially users linked to Airbus Defence and Space.

Where ? : The French maritime domain.

When ? : At any time, continuously.

How ? : The difficulty of identifying ships and their heading, particularly ghost ships, those near shores or sandbanks, and small vessels.

Why ? : To ensure safety at sea and protect the marine environment.

The problem : How can we detect vessels and their heading on satellite images that are difficult to interpret, in order to significantly improve maritime monitoring and management ?

© COmind

EE It is essential to understand the users' problem in order to know which solution should be proposed.

To clarify this problem, the 5W1H method can be used to understand:

What: the problem to solve.
Who: the people concerned.
Where and when: the context in which the problem occurs.
How: the way this problem manifests itself.
Why: why it is an issue and needs to be solved.

This analysis makes it possible to formulate the users' problem in a single sentence.

For the Shipmark project, this sentence is: "How can we detect ships and their direction, which are difficult to identify in satellite images, in order to significantly improve maritime surveillance and management?"

Third objective to reach

Are you addressing a critical issue?

1. User expectations identified

2. Needs understood

3. Critical issue addressed
